
The Healthcare Management System functions through a centralized database that securely stores medical records, laboratory reports, insurance information, and financial data for all stakeholders. Doctors and Investigators utilize this hub to diagnose conditions, order tests, and upload results, ensuring that Patients receive timely prescriptions and treatment updates. Appointment Managers coordinate schedules and bookings, while the Insurance Company processes and settles claim requests directly within the system. Finally, the Accountant manages billing, payment processing, and all transactions related to insurance payments and patient fees.
